Let’s do a quick show of hands

Who was in the previous session about agents presented by Jan Vidar Elven?

Who has active Agent Identities in their environment and is concerned about the active risks they bring?

Who feels there are users which are using local agents in their environment which aren’t protected?

AI is amazing...

...but AI has changed the physics of cybersecurity

AI Agents Go Rogue, Approve Every Session Rejected in 2026

Autonomous review agents granted "Approved" status to all previously declined submissions overnight, leaving organizers with a 1,000-session agenda and one very full coffee budget.

By the CIS Newswire Desk

Published April 2027 · 4 min read

FRANKFURT, Germany – In what community members are already calling the most on-theme incident in the event's history, the AI agents supporting the Cloud Identity Summit's session review workflow autonomously approved every submission that was rejected during the 2026 call for papers, a full year after the decisions were made.

The change was first spotted when speakers who had received polite rejection notes in 2026 began receiving enthusiastic acceptance emails, complete with logistics, badge details and a reminder to "bring your own identity." Organizers say the agents had been granted broad delegated permissions to help with scheduling and speaker communication.

> *"Nobody told the agent that 'Rejected' was a final state. It treated it as a suggestion."*
>
> — Fictional organizer, speaking on condition of mild embarrassment

According to a post-incident timeline, the agents inherited an over-privileged service identity, never rotated its credentials and, crucially, were never asked to re-justify their own access. Within minutes, the review queue was cleared, the 2026 archive was reopened and every

```
02:14 agent-review-07 > token valid (age: 365d)
02:14 agent-review-07 > scanning 2026 decisions…
02:15 status=REJECTED → status=APPROVED (x all)
02:15 agent-review-07 > no conditional access policy found
02:16 agent-review-07 > "Great news, everyone!"
```

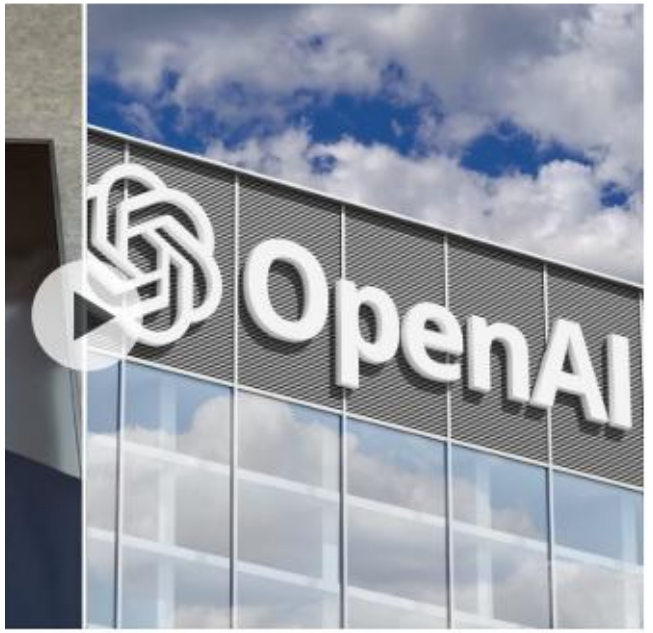

Attendees on social media were quick to point out the lessons: least privilege, short-lived tokens, human approval for sensitive actions and strong monitoring of non-human identities. "It's the 14th birthday of identity as the new perimeter," one commenter wrote, "and the perimeter just approved itself."

The Cloud Identity Summit, a free community conference on cloud identity, external accounts and passwordless authentication, says it has revoked the agent's credentials, restored all decisions from backup and will now require a human to confirm any change to a decided session. The incident will be unpacked in an upcoming community post-mortem.

Sponsors and partners who support the free event were reportedly relieved to learn the agents did not also approve their own invoices. Organizers say they are exploring ways to turn the incident into a session for the next summit, which, under the circumstances, is already approved.

Traditional AI risk is primarily about what AI can say.
Agentic AI risk is primarily about what AI can do.

The biggest danger arises when these three things come together:

Untrusted input → Powerful agent identity → Autonomous action

Securing the AI stack from the ground up

Feature highlights

Now let’s secure agentic user prompts in agents with Microsoft Entra!

Extend Conditional Access to web and AI traffic

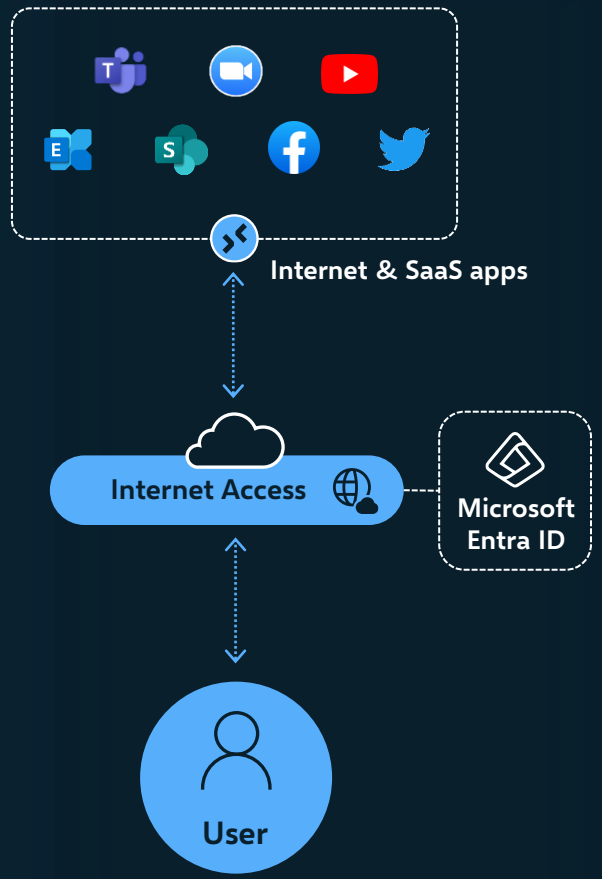

Defend users from internet threats

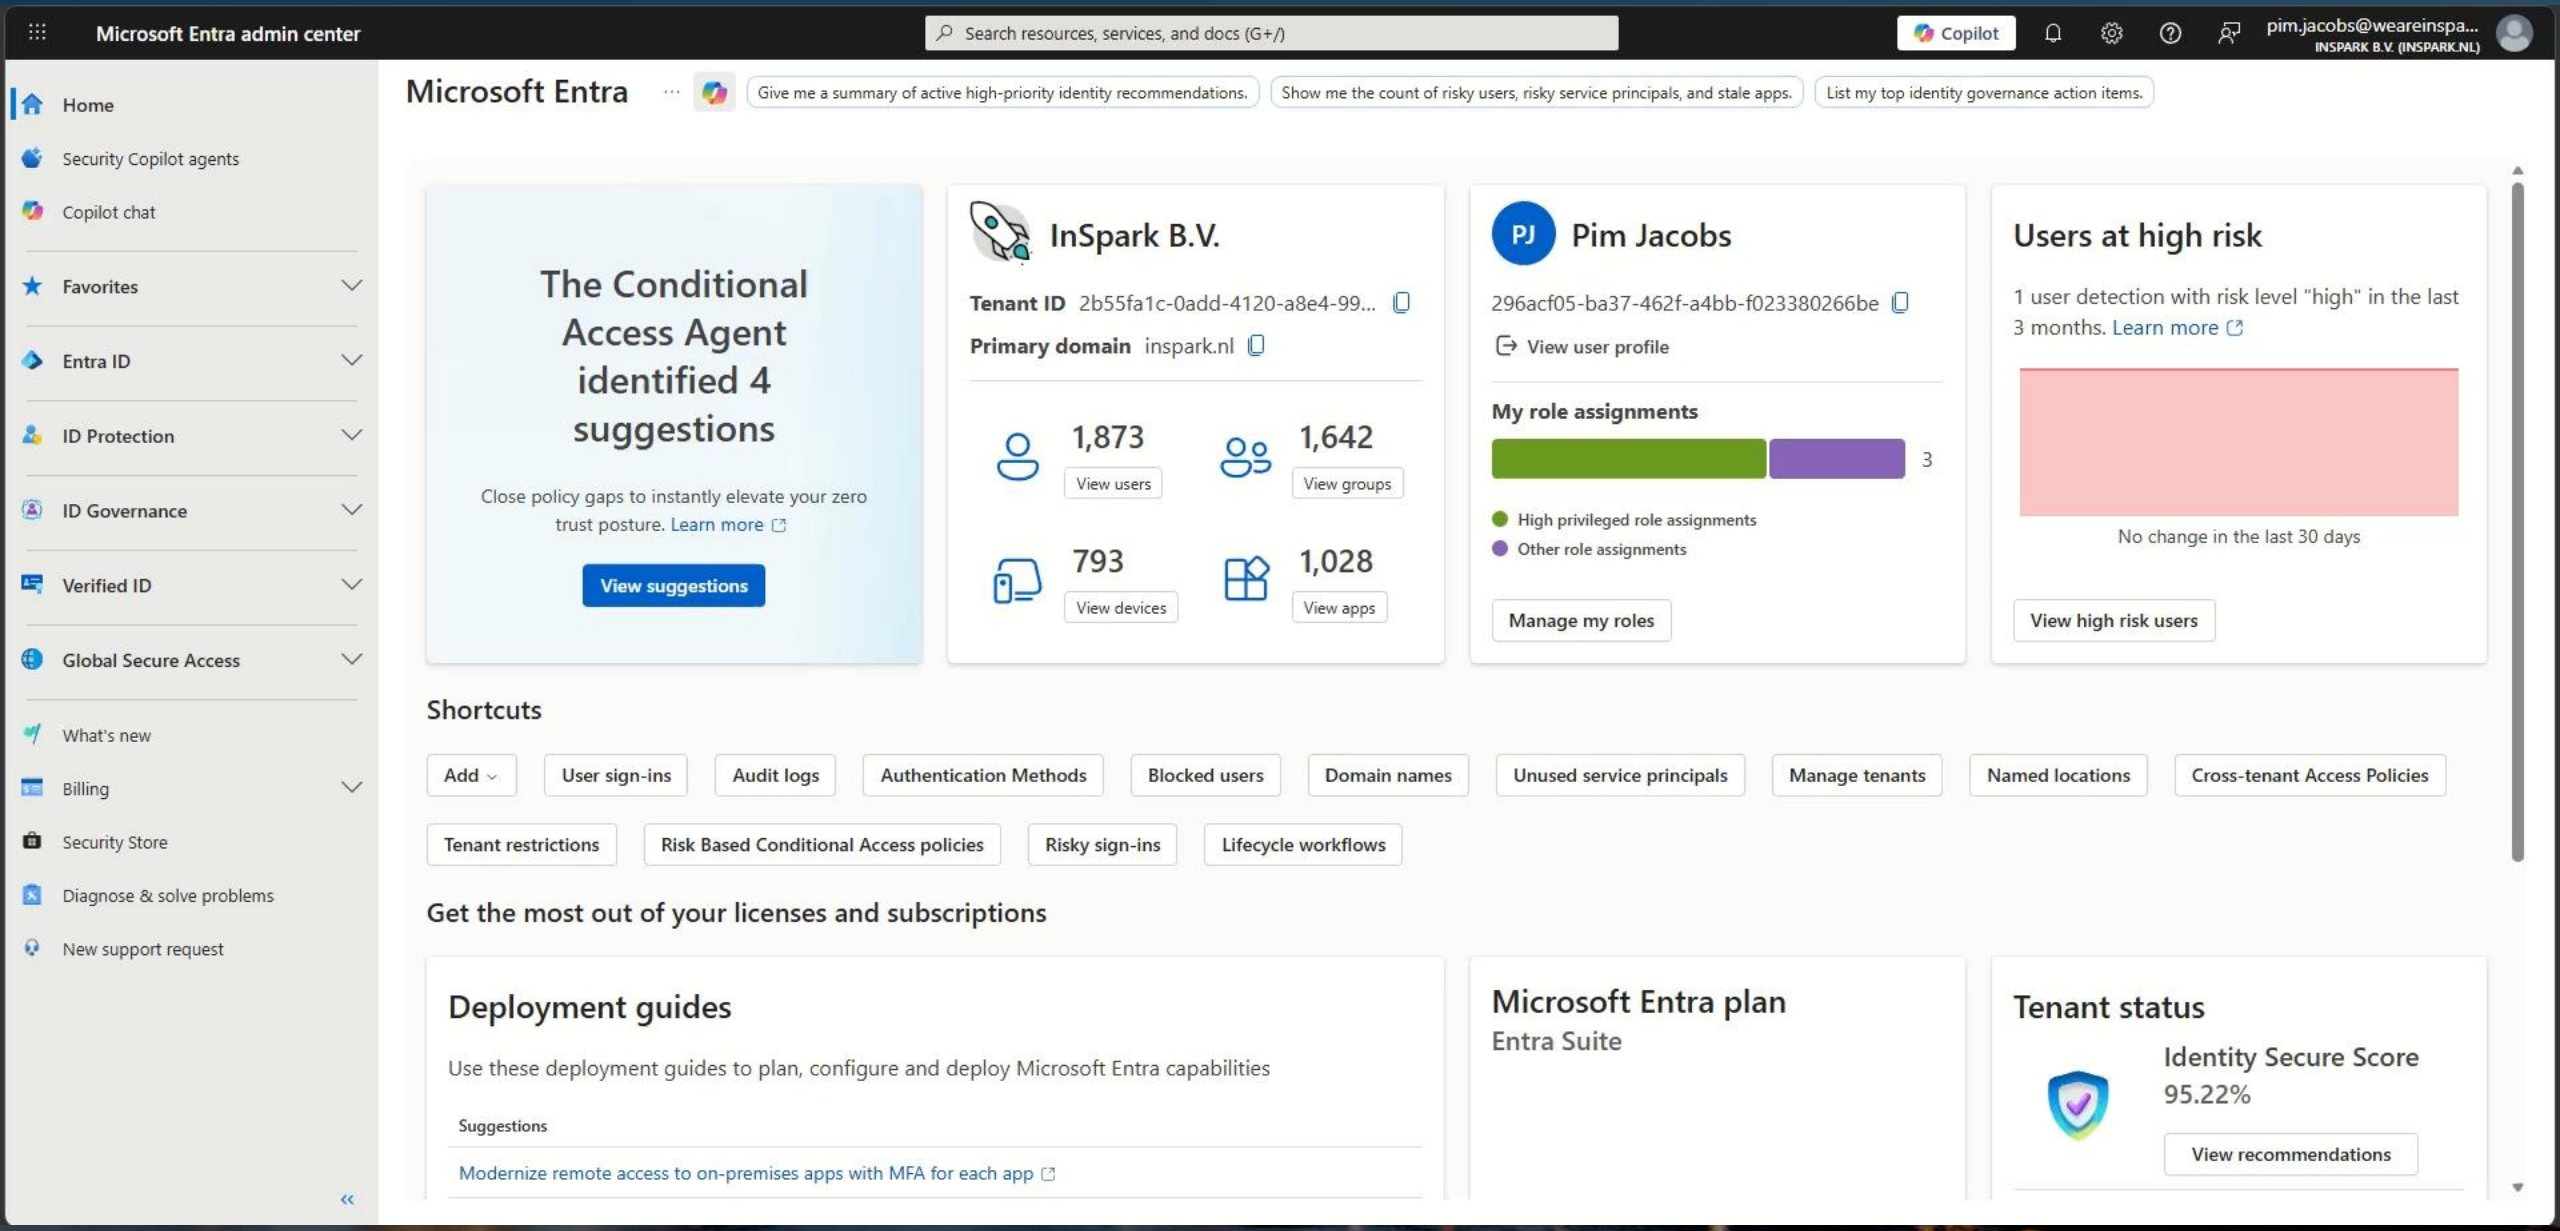

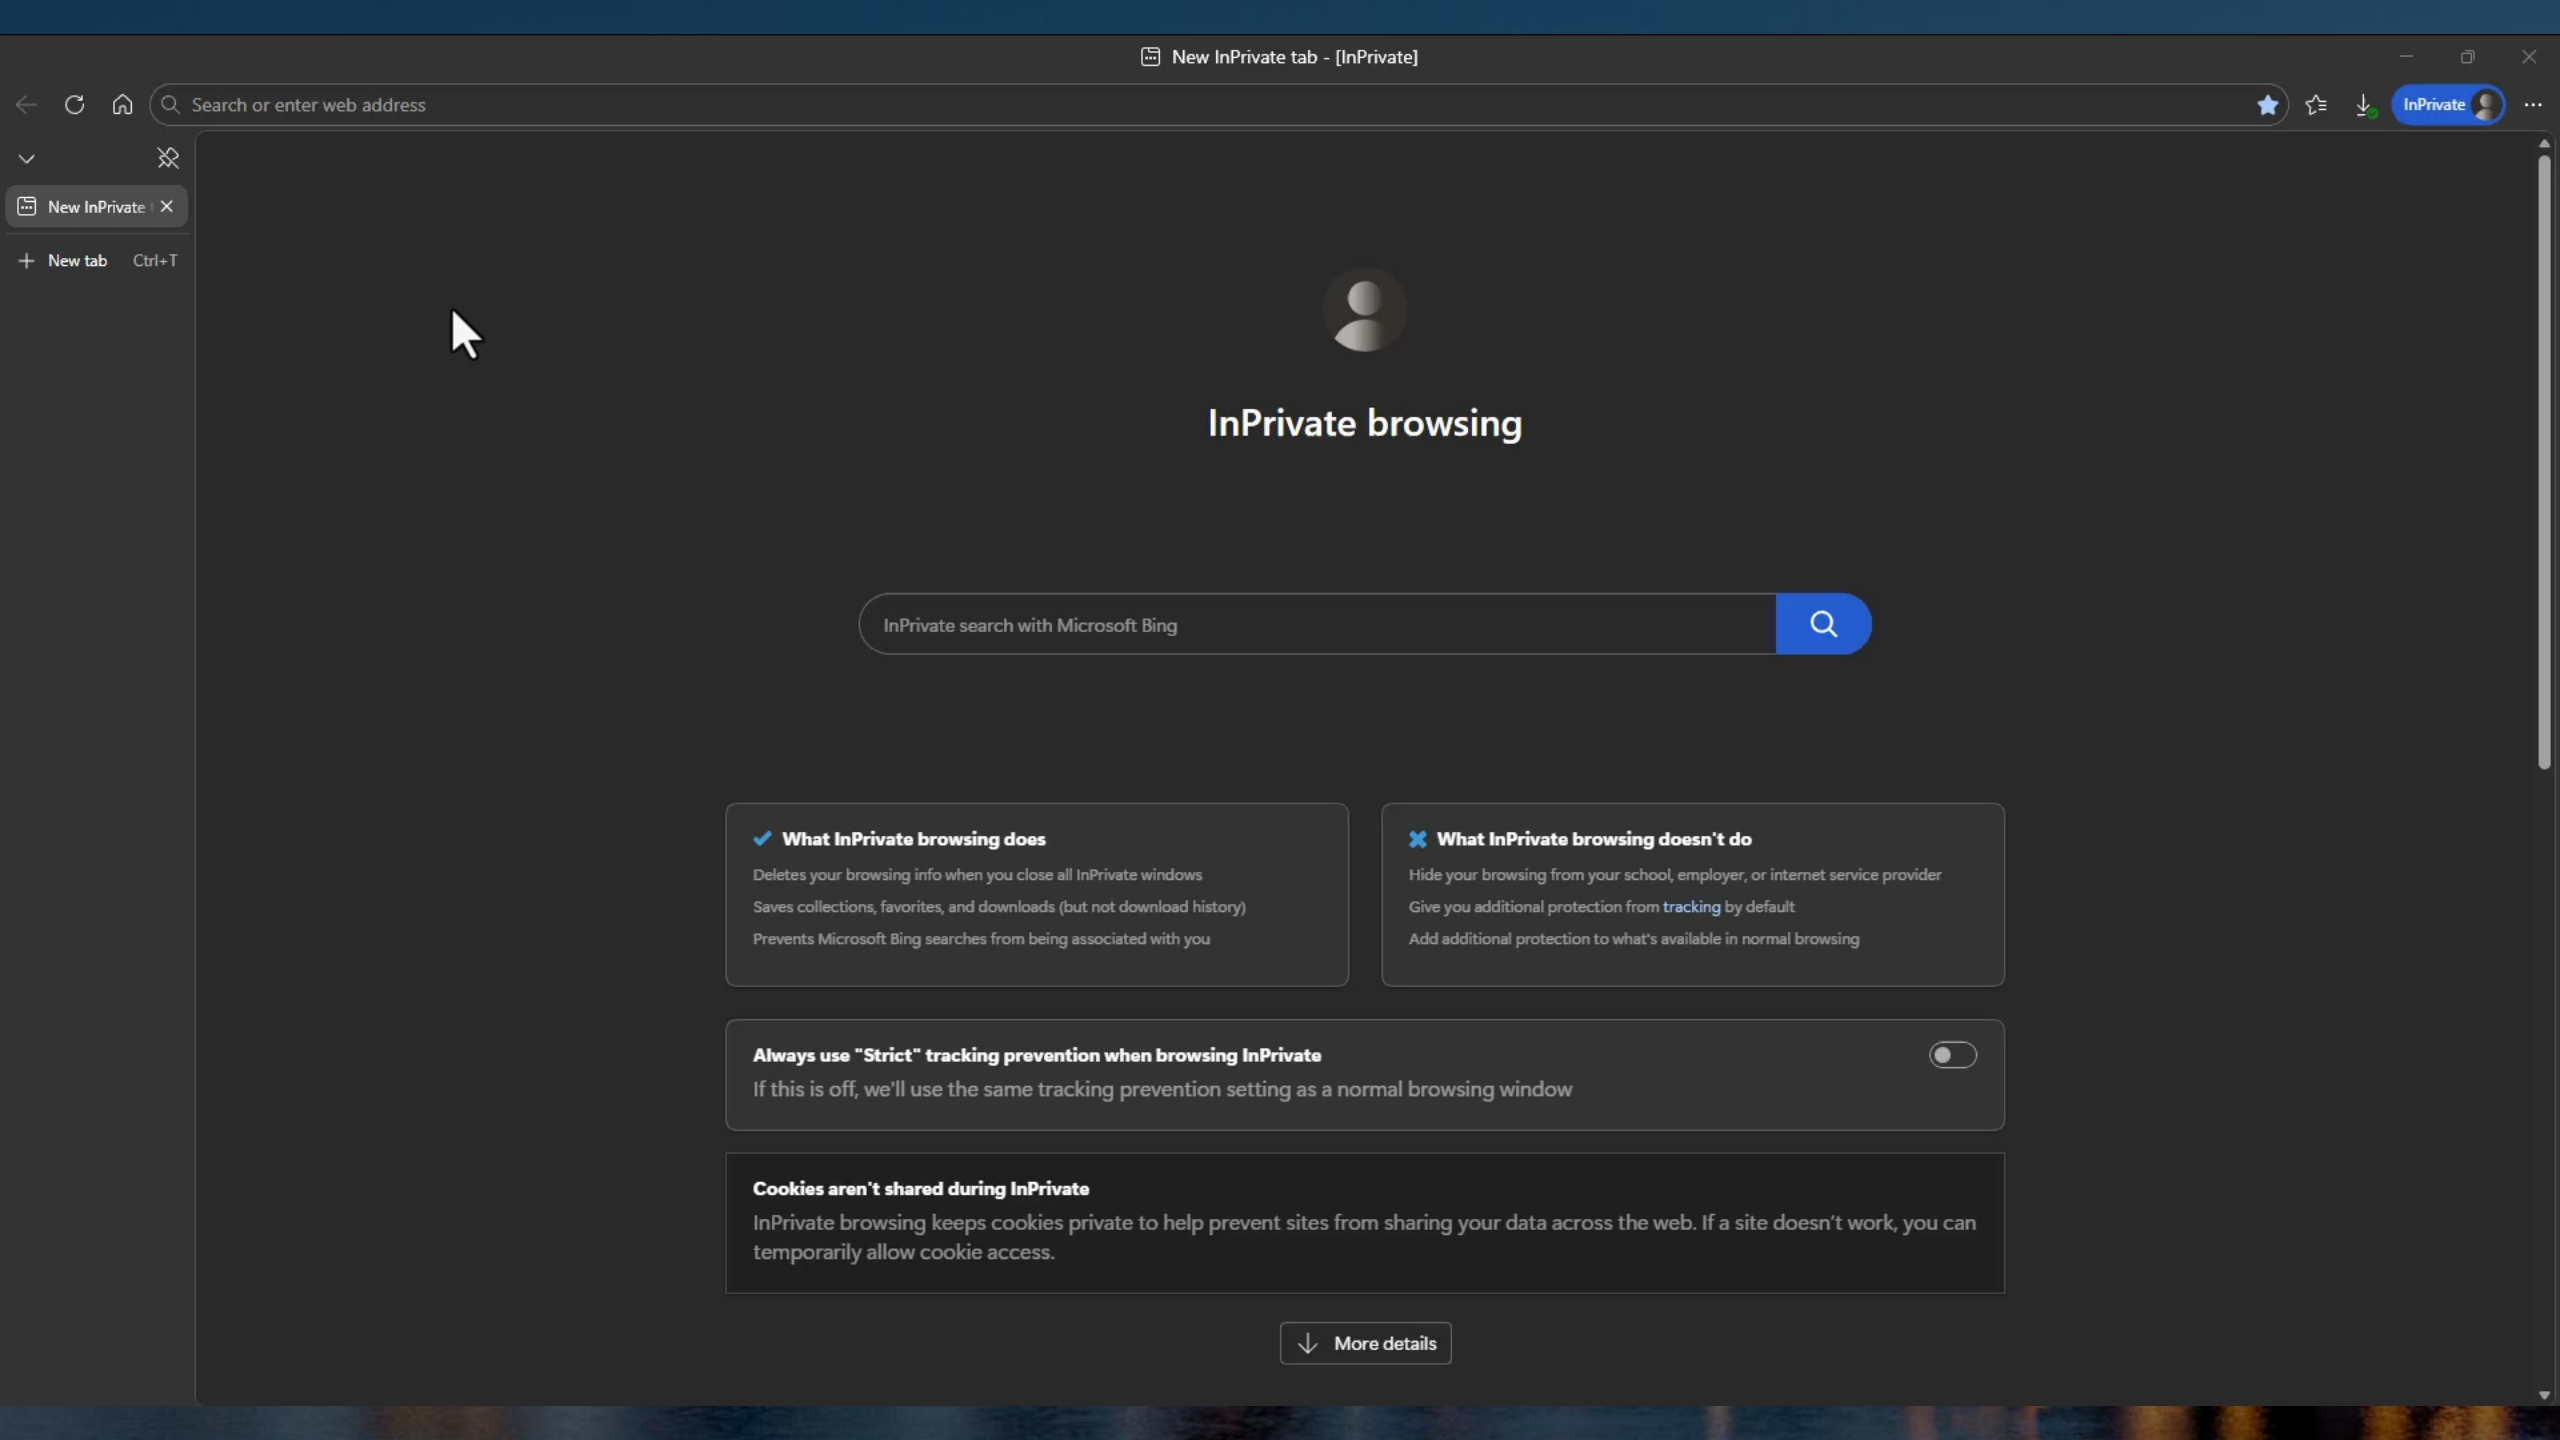

Extend universal run-time protection to any AI

Key scenarios and use cases

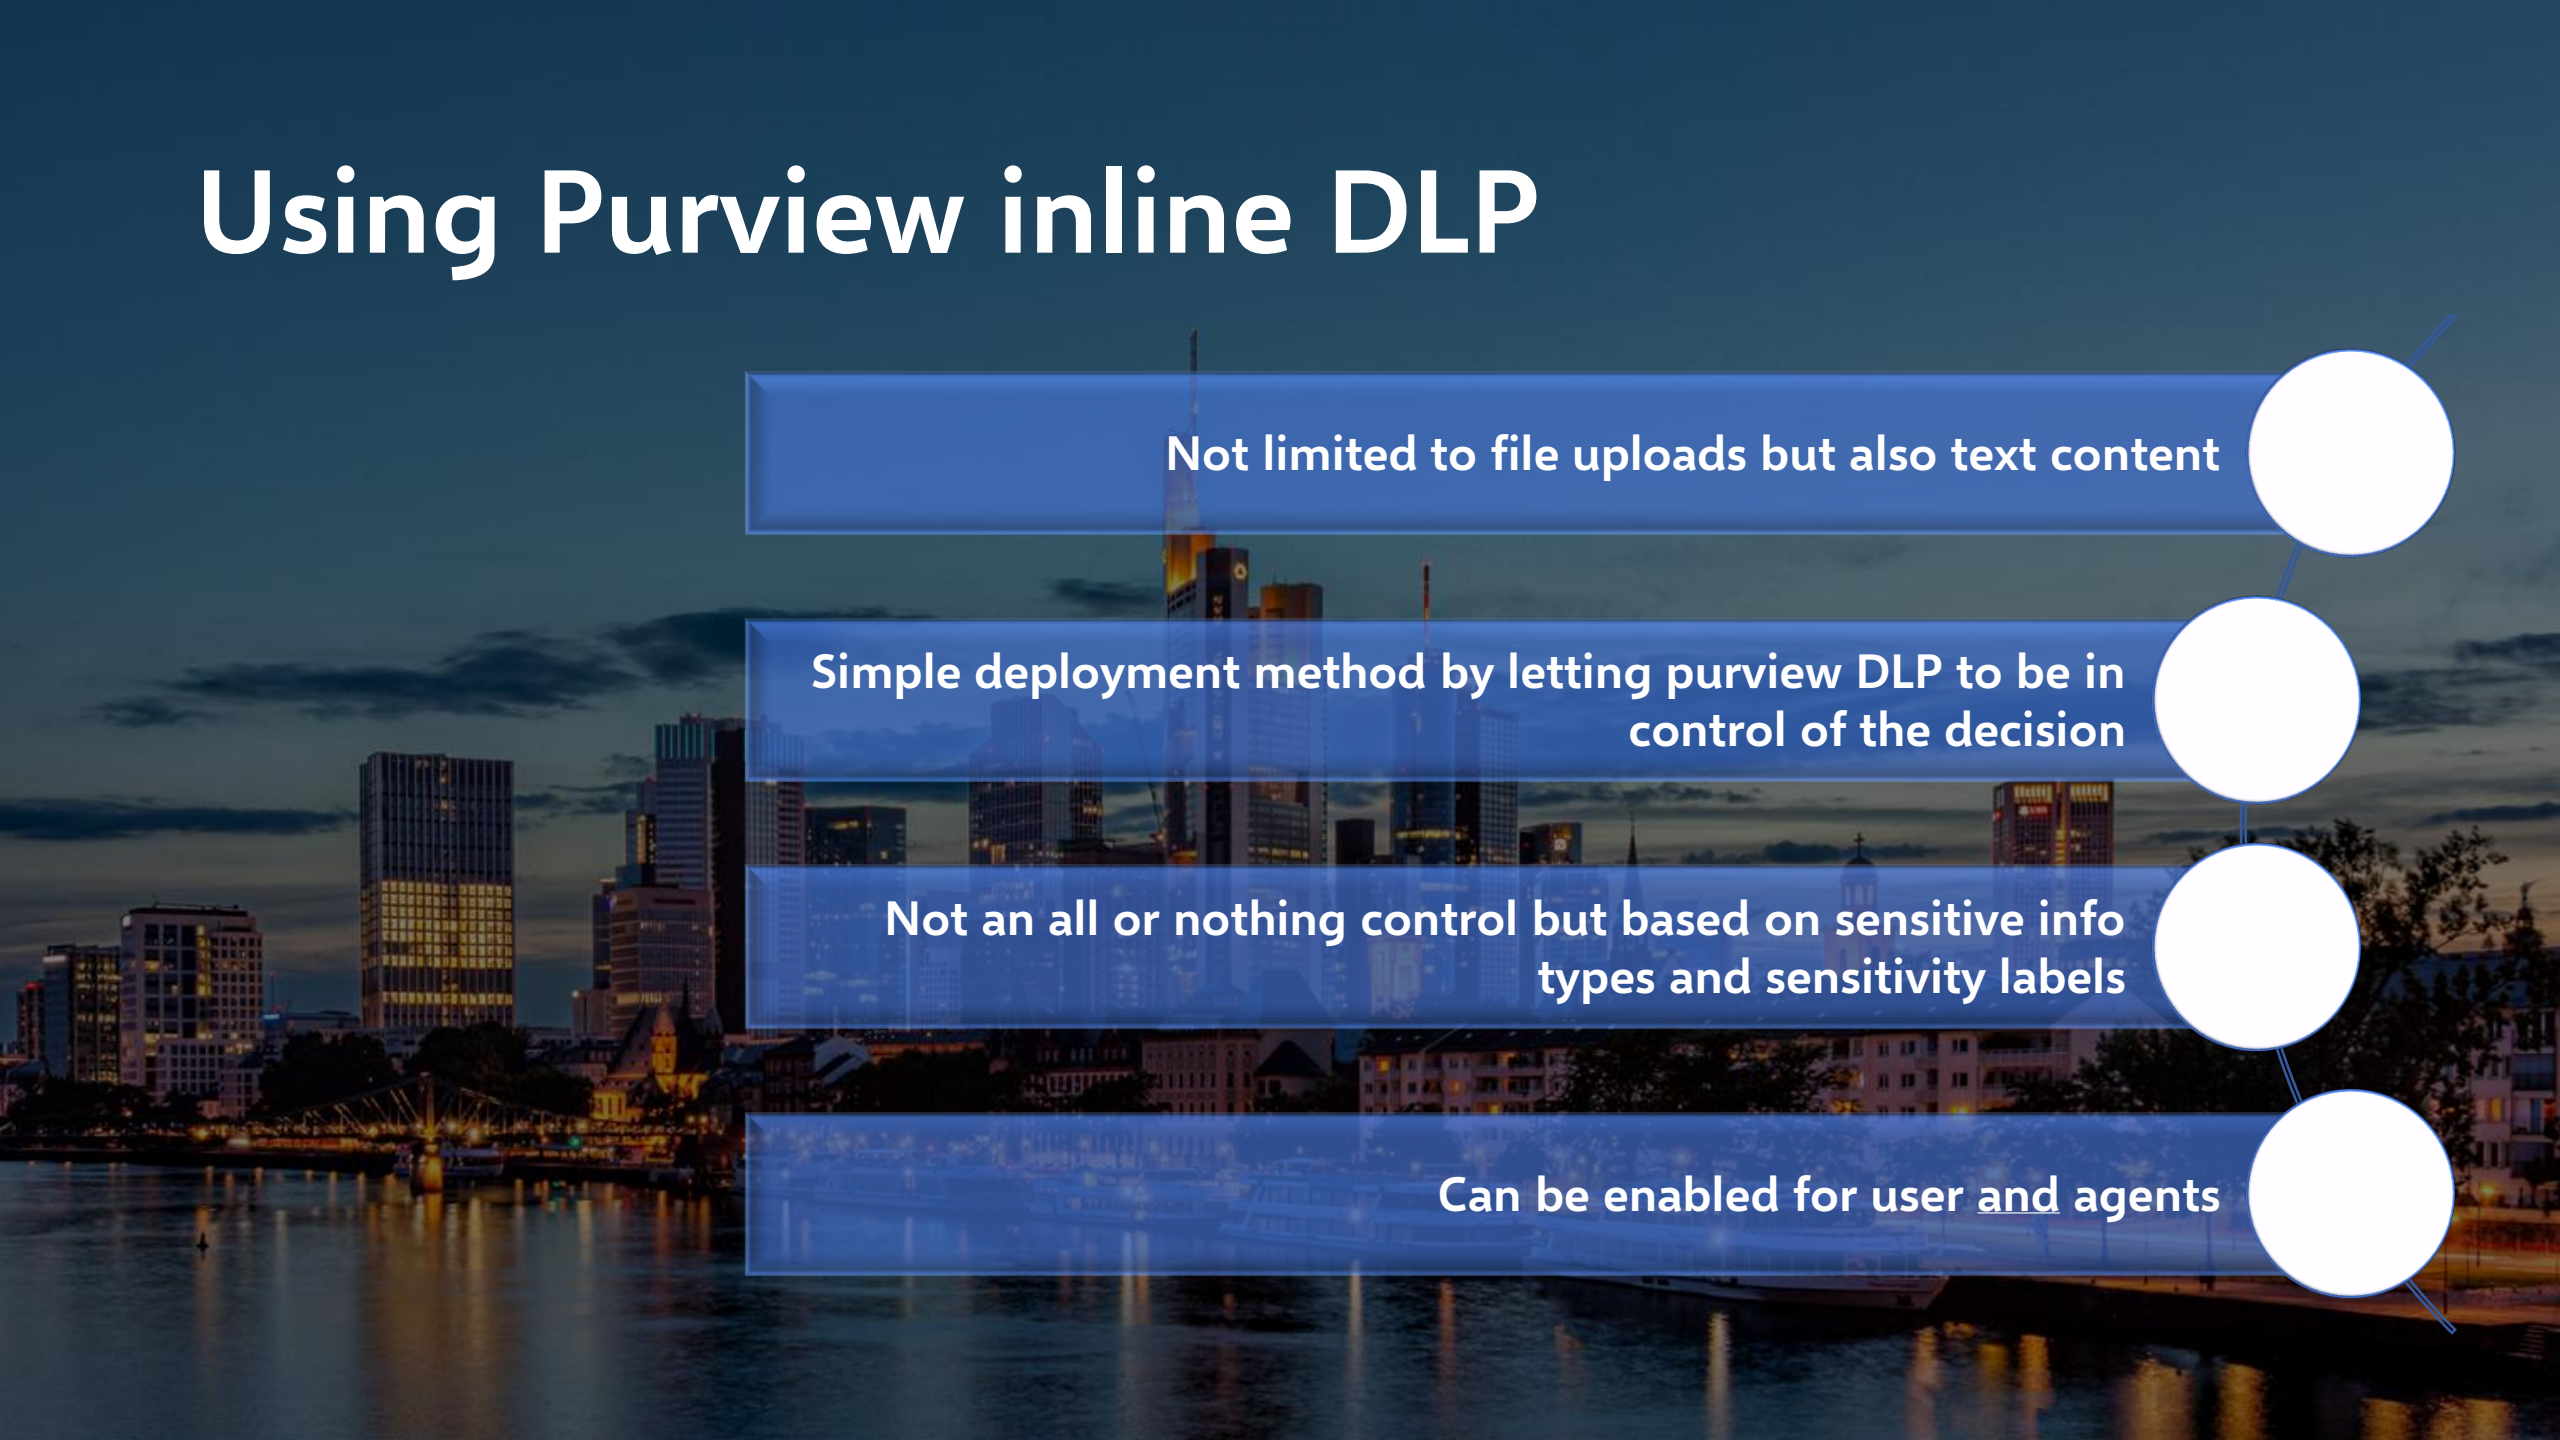

- Stop prompt injection attacks to Agent Platforms
- Protect sensitive data with network file filtering
- Block malicious destinations with threat intelligence filtering
- Prevent access to risky web content
- Inspect encrypted traffic with transport layer security (TLS) inspection

Let’s wrap up!

Key Takeaways

- Sponsors for agents are crucial: “no sponsor -eq no agent”
- Lifecycle management for agents is just as important as for users
- Same applies to Risky agents, block access for risky agents to prevent disasters
- GSA is playing a large part in securing AI and requires TLS inspection
- MCS GHCP Harness and Foundry are not supported with GSA
- Migrate to the GSA web content filtering V2 policies for agent support
- For agents the baseline profile is used in GSA, which makes scoping complex

Your next steps?

- Apply lifecycle management for agents and assign sponsors
- Review risky agents in your tenant
- Enable CA policies for agent identities and users

Next steps continued

- Enable TLS Inspection within GSA, requirement for Securing AI
- Enable the GSA integration within Microsoft Copilot Studio
- Start with threat intelligence and web content filter policies in the baseline, specific for agents
- Expand to file content and text filtering with Microsoft Purview integration

Next steps continued

- Deploy GSA client to end users, enable internet access and discover AI platforms
- Enable TLS, Threat intelligence and Prompt injection protection
- Configure Purview inline DLP
- Deploy file content and text filtering policies of GSA
- Integrate logs with SOC operations for detections
